### Sustainability Forum

**Sustainable Design Guidance:**  
 The Sustainability Forum is at the forefront of the most exciting developments in sustainable design, global warming, the impact of buildings and the achievement of the '2020' environment. It is an annual a set of helpful resources to help design teams and clients to a sustainable way of thinking about and delivering sustainable buildings. Available as an electronic and printed format. £25 per copy.

**Sustainability Policy:**  
 A clear statement of our design sustainability policy and how we will achieve it. Available as a printed and electronic format. £10 per copy.

## The slums of Dharavi – Mumbai

keeping communities together through principles of one  
planet living  
for a secure and sustainable future

## Health and Happiness

### Case Study: One Planet Living, UAE

#### Masdar Development

The Masdar development will have a cultural centre where annual events programme that includes a celebration of heritage for all demographics and religious groups throughout of Masdar can take place. Conventional projects in the UAE are thought to give little consideration to the existing and development conditions of the inhabitants but the developers of Masdar City are seeking to challenge this assumption by introducing excellent accommodations, for single and world class and safety measures for construction work.

### The Global Problem

Our increasing consumption is not leading us to increased health and happiness. It is leading to environmental damage.

### The Local Problem

There is little provision for formal healthcare locally and no hospital for the 1 million people living in Dhawal. Oral local ailments, caused by poor sanitation, are prevalent within the community. Small, localised industries have significantly contributed to the wealth poor air quality with their use of air-borne and small-borne. The reality is that these small local businesses cannot afford to ensure the health and safety of their workforce.

## Equity and Fair Trade

### Case Study: One Planet Living, Morocco

The One Planet Living project in Marrakech has identified ways in which hotels within the tourist development can support local businesses and communities by supporting the local tourism chain. Full wages and working conditions and be encouraged for all workers in the CPE development, for example in gift handicrafts and hotels for the table and goods for sale in the hotel boutiques.

### The Global Problem

Some in the subcontinent would live in relative poverty, while many in the developed world cannot meet their basic needs from what they can produce or sell.

### The Local Problem

Many forms of the commercial activity within Dhawal is legal. The wages incidents exist to exploitation, whether in working conditions or pay and impact directly on the quality of life for residents and workers. The industries within Dhawal - tourism, jewelry, food processing, garment business, jewelry, games and metal work, have made a number of the state's middle class. Some of these industries are manufacturing goods for a global market and there is local pressure about the re-employment program. Poverty grows from low wages, inequity with informal and precariat jobs.

## Natural Habitats and Wildlife

**Case Study - One Planet Living, USA**  
**Sierra Mountain Village** is a 200-acre development, zero-waste development in Redwood Park, California. By reusing seasonal materials from their current developed sites and creating people and a natural corridor to link habitats, creating ways to attract and nurture environmental practitioners of the California Lightfoot Community. Sierra habitat restoration will emphasize diverse habitats of trees, rocky slopes, forest understory, garden communities, and green roofs with undisturbed nesting habitat.

**The Global Problem**  
 The global problem is the loss of biodiversity and natural habitats due to development in natural areas and the over-exploitation of natural resources.

**The Local Problem**  
 The high density of El Estero means that much of the district has little in its green to the open spaces that would support natural habitats and native species. Sector 8 is the location of Sierra Nature Park - a former area of water ground which is now an educational nature park. Though native species, such as the Goldeneye Tree, are located within El Estero, they are not properly maintained.

## Sustainable Water

**Case Study: One Planet Living Morocco**  
**Marrakech**  
 Development in and around Marrakech is creating a significant burden on the already stretched local water resources. The One Planet Living development needs to address this issue by using water-efficient fittings and water-saving programs with an education program to reduce consumption and recycle as much water as possible on site. Through a blackwater treatment plant for use in toilet flushing and irrigation, innovative methods of water collection, such as grey water collection, are being investigated as innovative sources of water.

**The Global Problem**  
 Rapid increases in freshwater use increasing the pressure and often result in the depletion of existing stocks.

**The Local Problem**  
 Uncontrolled development, with the associated population growth, has led to high demand for water. Not all properties have access to running water, leaving the communities vulnerable during droughts. Demand for water management is far greater than the infrastructure potential - just 1 toilet for every 1500 people results in open sewers throughout Marrakech. Flood risk is high within El Estero, through both stormwater and river flooding during seasonal season.

## Culture and Heritage

**Case Study: One Planet Living China, Jiaohan**  
The project partners preserve the culture and heritage attributes through strategies that include the development of a 'cultural street' and appeal to the local Lushanese citizens. A 'cultural' Community Library will be created within the public space around Jiaohan Art and Heritage Site. Heritage will be exhibited. This will also provide a platform for the City Opera and the building itself will be a symbol of community spirit.

**The Global Problem**  
Local cultural heritage is being lost throughout the world because of urbanisation, resulting in the loss of local identity and tradition.

**The Local Context**  
The aim that the key aspects of local culture and heritage that enhance the community of Dhaka include:  
• Performance and entertainment (Bollywood)  
• Religion (many temples, religious festivals)  
• Cricket  
• Industry and trade (shopping, getting, cleaning and cooking services for the neighbouring areas)

## Local and Sustainable Materials

**Case Study: One Planet Living, UK  
Brighton, NECC**  
The development will be constructed using materials that offer high performance in use, but have minimal impacts in mining, manufacturing and transportation (including wood from sustainable and certified sources). The main structure of the two blocks (A and B) design will be a concrete frame with exterior cladding made with recycled materials. Developed by Natural Building Technologies, the system is based and designed to build with and not outperform other masonry systems while offering similar build costs.

**The Global Problem**  
Destructive patterns of resource exploitation and use of non-local materials in construction and manufacture increase environmental harm and reduce gains in the local economy.

**The Local Problem**

## Sustainable Transport

### Case Study: One Planet Living, South Africa

#### Goals

- The project needs to change an 80% private car use to an 80% public transport use through the following strategies:
  - Providing facilities within walking distance to reduce the need to travel e.g. local shops, ATM, healthcentre
  - Providing free shuttle buses to Durban, linking in to the existing public transport network, with costs covered by monthly rental charges
  - Making the private car parking available

### The Global Problem

Excess car use and excessive traffic contribute to climate change, air and noise pollution, as well as congestion.

### The Local Problem

There is poor public transport planning and implementation, due to the rapid expansion of Durban and the high-speed development has resulted in little or no street design. Much of the area is inaccessible to traditional modes of transport - we need to promote emerging vehicle access and the fact that private car and motorcycle ownership is likely to increase in the future.

## Zero Waste

### Case Study: One Planet Living USA

#### Reduce Mountain Village

The plan will limit the total solid waste sent to landfill to 2% by 2025, ensuring that at least 98% of waste by weight is recycled, composted or incinerated. After designing for waste minimization and future responsibility, Challenge issued a new standard set of specifications to reduce the use of disposable materials throughout the site in a sustainable factory environment on site. A new factory ([www.southpark.com](http://www.southpark.com)) produced by garbage, less on 80% less paper and plastic waste, and few operations that use electricity to produce.

### The Global Problem

Waste from domestic products and packaging create a huge global challenge and requires viable resources.

### The Local Problem

Uncontrolled development has led to poor infrastructure planning and development. It is not possible for waste collection services to reach every corner of Durban and there is no parking for the collection of waste that is non-recyclable. There is increased engagement of waste and non-recyclable waste with Durban.

## Zero Carbon

### Case Study: One Planet Living Abu Dhabi

#### Master Development

Muscat City will be the world's first zero-carbon, zero-waste, zero-toxic city. The Regional Plan for the development of an ambitious Sustainability Action Plan that aims to create One Planet Living at Muscat, in association with developer Mubadala, the Federal & Partners, engineering firm and WSP | PAR. Zero carbon will be achieved through a combination of measures that include urban density to keep foot prints out of the city, the shading of buildings and corridors and high thermal performance of building facades.

#### The Global Problem

Climate change has been caused by the build up of carbon dioxide (CO2) in the atmosphere. The solution is a result of human intervention.

#### The Local Problem

Uncontrolled urban sprawl has led to poor infrastructure planning and development and the jostling of nature and use of generators to supply power. The rapid growth in Dharavi has been a key factor in increasing energy demand. More generation of electricity produced in India over the next 15 years, Mumbai will see an increase in energy demands of up to 50% and where electricity is available, its use is likely to be affected due to scarcity.

The 'Zero Carbon' principle implements energy efficiency in buildings and infrastructure, supplying Dharavi with energy from on and off-site renewable sources.

#### Passive Design

The measure takes full account of the energy efficiency of passive and active measures, reducing energy demands by:

- Minimising wind gains
- Minimising mechanical ventilation requirements
- Providing good access to natural light

Where mechanical ventilation is to be used - for shops, office and commercial properties - passive design responses minimise climate demands.

#### Energy efficiency

Measures will ensure that where required, energy efficient appliances and lighting are used to minimise energy demand. The thermal performance of the building will be maximised, providing a comfortable internal environment, and ensuring the treatment for mechanical climate control. Use of on-site energy generation will provide carbon reductions and where required, mechanical ventilation or cooling will be provided via in-generation, thus utilising the waste heat from the energy generation process.

Neptune will reduce energy consumption by 70% compared to the baseline and provide external lighting using solar photovoltaics. We plan to supply 100% of energy from renewable sources by 2020.

#### Renewables

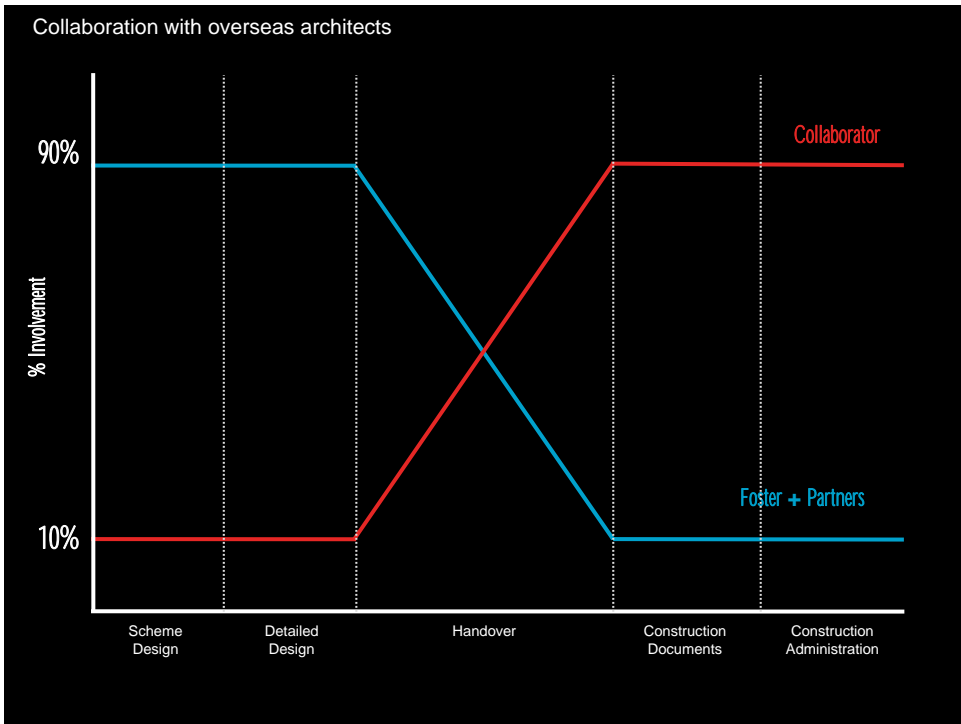

Where appropriate, solar water heating will be provided on-site. This system will contribute to the individual building's hot-water requirements. Additional energy demand can be met with off-site renewable energy facilities and associated grid to the use of an off-site wind or solar farm. These systems will be required to meet the demand for generating this carbon emissions by 2020.

How do we use invention – the human capacity to explore new ways of doing things – to the benefit of future generations?

By pushing the boundaries of what is possible now – through design – we can make a difference to how societies develop in the future.

**Storm Water Management**  
 About 87% of yearly precipitation in Dharavi is concentrated in the monsoon season and the rains cause flooding. Over the years, the problems related to transportation, a number of health issues are linked to this, increasing the poor hygiene conditions of the site and increasing the spread of water-related diseases.

**Electricity**

**Waste**  
 Waste has a two-fold aspect within Dharavi. On one side the total lack of conventional collection, sorting and maintenance systems worsens the health conditions of the community. On the other, Dharavi is an exemplary recycling community. Recycling is one of its main industrial activities and the city requires waste and gas generated within Dharavi, but also a significant percentage of Mumbai's waste.

## The ten One Planet Living principles behind New Dharavi

### Health and Happiness

**Health and Happiness**  
 The strategies identified in the masterplan will improve the health, reduce knowledge and awareness of Dharavi. Through NewDharavi's sensitive approach to regeneration, the social cultural aspects of the site will be retained and improved.

### Equity and Fair Trade

**Equity and Fair Trade**  
 Regenerative approaches to the project encourage, involving the community, protecting livelihoods and creating income-generating activities within the redevelopment process.

### Culture and Heritage

**Culture and Heritage**  
 The project will aim to preserve and highlight elements of the local culture and heritage.

### Natural Habitats and Wildlife

**Natural Habitats and Wildlife**  
 Dharavi's redevelopment will protect the existing Mahatma Jyotiba Phule Park, while creating a landscape strategy based around the ecological services required on site.

### Sustainable Water

**Sustainable Water**  
 The provision of clean water and sanitation for all residents of Dharavi is key to our progress. Through efficient equipment and facilities, domestic water use will be reduced. Flood risk will also be managed through revised building thresholds and improved flood defences.

Local Food	Sustainable Materials	Sustainable Transport	Zero Waste	Zero Carbon
 	 	 	 	 
<p><b>Sustainable Food</b>            Dharam will cater and support to farming industries related to food consumption. We have an extensive program to improve food knowledge within the community and combine environmental protection with food growing.</p>	<p><b>Local and Sustainable Materials</b>            We have will make maximum use of local, locally, natural, recycled and recycled materials to reduce embodied energy, waste production and the other negative environmental impacts of construction.</p>	<p><b>Sustainable Transport</b>            We will work with local partners to create an integrated transport strategy that will significantly reduce air pollution in Dharam and meet with the existing transport network.</p>	<p><b>Zero Waste</b>            We aim to reduce, reuse, recycle, compost and use technology to divert waste from landfill, reaching 90% diversion by 2025.</p>	<p><b>Zero Carbon</b>            High thermal efficiencies in building fabric, passive solar design and efficient appliances will reduce energy demand of Dharam to a minimum level. The remaining demand could be offset through offsetting and on-site solar, reducing our energy emission impact to 20%.</p>
